

Understanding Human Behavior with Cognitive Models - Travaux Dirigés (TD)

Installation

Try to you complete the installation before the first TD session to save time!

1-Download the files

- Create a folder on your computer where you will store all TD files.
 - Download the attached files `environment.yml` and `td0_test_installation.ipynb` and place them in the folder you just created.
-

2- Install Python and libraries

A) ADVANCED: If you already have Python installed (and you are familiar with the command-line terminal) You will need a virtual environment with Python 3.11 and the dependencies listed `environment.yml`. You can create the new environment named `tdenv` with this command:

```
conda env create -f environment.yml
```

B) BEGINNER: If you need to install Python on your computer I advise installing it with the [Anaconda distribution](#).

Anaconda takes up about 4 GB on your hard drive. If you are concerned about storage on your computer, you can also download [Miniconda](#), which is a smaller Python distribution that contains very few pre-installed packages, and doesn't come with Anaconda's user interface (**Anaconda Navigator**). If you prefer to avoid using command-line terminal, and especially if your computer runs on Windows, then Anaconda is a better choice for you.

Once you have installed Anaconda:

1. Open the **Anaconda Navigator** application
 2. In the **Environments** tab (left side bar), create a new **conda environment** for the TDs:
 - Click on the **Import** button at the bottom of the Environment list
 - Select the `environment.yml` file that you downloaded previously
 - Name the new environment `tdenv`
 - Wait for the environment to be created. All the necessary libraries will be automatically installed.
-

3- Testing your installation

All our TDs will be done on Jupyter Notebooks. The **JupyterLab** app is appropriate for the work we will do. To check that you are ready for the first TD, run the `td0_test_installation.ipynb` notebook in JupyterLab:

1. In the Anaconda Navigator, go back to the **Home** tab, install and launch the **JupyterLab** app. It will open in your browser.
2. In JupyterLab, find the `td0_test_installation.ipynb` file where you placed it and double-click on it.
3. The **TD0 - Setup** notebook will open. Just run the first code cell (with the imports) to check if the installed packages are working.

ADVANCED: To launch JupyterLab with the terminal, go back to the directory you created, activate the conda environment and launch JupyterLab:

```
conda activate tdenv
jupyter lab
```
